1. Descripción del Proceso

El código que se creó es una aplicación de Streamlit simple. Este tiene como objetivo transcribir un audio que se le proporciona a la aplicación y finalmente te muestra el texto del audio al igual que un resumen en bullet points agarrando las ideas principales de este. Para que funcione la aplicación, se utilizó la API de Whisper de OpenAI para poder transcribir el archivo de audio que se le proporciona para después utilizar el API de ChatGPT y hacer el resumen en bullet points de las ideas principales. Como se puede observar en la Figura 1, el código las variables openai.api_key y model = whisper.load_model('base') representan tanto la API de ChatGPT como el modelo de Whisper. Después se tienen dos funciones que son de suma importancia para la ejecución del código:

- transcribe_audio(model, file_path): Esta función utiliza el modelo de Whisper para hacer el transcript del audio ubicado en el file_path que se asigna.
- Custom_ChatGPT(user_input): Esta función se encarga de hacer el resumen del texto que se le envía mediante la variable user_input.

Finalmente, vemos como hay varias variables con la variable st, estas únicamente representan la interfaz que se hace mediante Streamlit para poner títulos, subtítulos y el texto que le añadirá el usuario, el cual es el path al audio. Finalmente tenemos if $file_path$ el cual representa que si se puso un path al textbox, se correrá la función $transcribe_audio(model, file_path)$ sobre ese audio y finalmente la función $Custom_ChatGPT(user_input)$ sobre el transcript que se haya obtenido anteriormente.

2. Evidencias del Funcionamiento del Programa

```
mport streamlit as st
      import openai
      import whisper
      openai.api_key = 'COLOCAR API DE CHATGPT (LO BORRÉ PARA QUE NO ME COBREN EN CASO DE QUE ALGUIEN AGARRE EL CÓDIGO)'
      model = whisper.load_model("base")
      def transcribe_audio(model, file_path):
         transcript = model.transcribe(file_path)
          return transcript['text']
      # Función para la interacción con ChatGPT
      def Custom_ChatGPT(user_input):
              {"role": "system", "content": "You are an office administrator, summarize the text in key points"}, {"role": "user", "content": user_input}
          response = openai.ChatCompletion.create(
              messages=messages
          ChatGPT_reply = response["choices"][0]["message"]["content"]
          return ChatGPT_reply
      st.title("Transcripción y Resumen de Audio")
33
34
      # Subida del archivo de audio
      file_path = st.text_input("Enter the path to the audio file (Ej: /Users/federicomedina/Documents/Repositorios/Whisper-ChatGPT-Audio/MA1.m4a)")
          # Transcripción de audio
          st.subheader("Transcripción:")
39
40
          transcription = transcribe_audio(model, file_path)
          st.write(transcription)
          st.subheader("Resumen:")
          summary = Custom_ChatGPT(transcription)
```

Transcripción y Resumen de Audio

Enter the path to the audio file (Ej: /Users/federicomedina/Documents/Repositorios/Whisper-ChatGPT-Audio/MA1.m4a)

Transcripción:

Especially, and I would even argue in the last four weeks, you really can't build fitness for the Iron Man distance. But you can ruin your fitness for the Iron Man distance, especially within the last two to three weeks. So it takes your body to adapt to a full load, a full Iron Man load. It takes four to six weeks for your body to fully adapt to it. For you to go through the full depression cycle all the way through the compensation cycle and come back to the place where you're ready to race again. So if you take your body and you're in that super compensation phase and you start training in that which is going to be in these last two weeks which you're in right now. And you add load to it and drop down again. You're going to lose everything that you gained from those big efforts that you did in the four to six weeks out from your race. Okay, so you have to give your body time to rest. You need to let your body fully recover from those efforts and even get stronger. So you can keep the sword sharp by doing short quick efforts. You can get out the door to work out some of your whatever your issues are. They're mental. I need to go out and do something. Fine. Zone one, zone two, easy, 30, 45 minutes to at least open the body up and remind

Figura 3: Parte de cómo se ve la interfaz al ingresar un path correcto (Transcript)

to absorb the carbohydrates. So, even if you keep slamming gels, you're, you're, you're, you end up with this like lead weight in your stomach because you aren't able to, the stomach's not able to process it because it doesn't have enough salt in your stomach cavity to absorb the liquid. And you really need dialent, the right amount for you, because there's a huge range on what people need for salt. There's really heavy salt sweaters and there's light, and you can do too much salt. And you have this like really similar light cramping from too much salt, so you really need a dial in in your training.

Resumen:

- · Building fitness for an Iron Man distance is not possible in the last four weeks leading up to the race
- It takes four to six weeks for the body to fully adapt to the Iron Man load
- Training in the last two weeks can ruin the progress made in the previous four to six weeks
- · Rest and recovery are important during this phase, with light workouts to keep the body active
- Weight training should be avoided in the last two to four weeks unless consistently incorporated throughout the training period
- Volume should be gradually reduced in the weeks leading up to the race, with about 50% of peak volume two weeks out
- Tapering strategies may vary for each individual and may require trial and error to find the most effective approach
- Adequate nutrition is crucial for Iron Man performance, and it is recommended to practice different strategies during training to find what works best
- Redundancies should be built into nutrition plans to account for potential mishaps during the race
- Salt intake is important for proper carbohydrate absorption and cramping can occur due to imbalances in salt levels
- Finding the right amount of salt for individual needs is crucial and can be determined through training trials
